

Technology Risk & GRC Capability Matrix

A concise view of current capabilities, supporting work, and the business value each area provides.

Evidence as infrastructure. Security as culture.

Core capabilities

Capability area	Current work	Contribution
Risk & Controls	- Document system context and control implementation - Evaluate control design and evidence sufficiency - Translate gaps into risk scenarios - Track remediation through accountable closure	Produces review-ready records that show what is expected, what evidence supports the conclusion, and what requires action.
Compliance & Assurance	- Map evidence to stated requirements - Review documentation for completeness and traceability - Write findings with defensible support - Prepare teams for internal review	Helps reviewers reach conclusions efficiently and helps teams address documentation gaps before they become repeat findings.
Governance & Program Operations	- Coordinate owners, reviewers, and decision-makers - Set reporting and escalation routines - Maintain issue and evidence visibility - Connect operating needs with governance expectations	Keeps ownership visible, decisions documented, and work moving across teams with different responsibilities and priorities.
Risk Communication & Learning	- Connect technical findings with business context - Adapt risk language for technical and nontechnical audiences - Preserve severity and urgency without creating alarm - Use narrative learning to make risk behavior recognizable	Supports informed decisions and stronger security conversations across executives, clients, operators, and technical teams.

A cross-functional strength

I connect technical findings with the business context people need to make sound decisions. The goal is direct communication that preserves the severity and urgency of the risk without creating unnecessary alarm.

Where the portfolio demonstrates the work

Each artifact below is a constructed case study or learning asset designed to show the work product directly.

Portfolio artifact	What it demonstrates
<u>TRACER System Security Plan Case Study</u>	System context, control narratives, implementation status, and responsibility mapping.
<u>TRACER Security Controls Assessment Case Study</u>	Evidence-based control assessment, testing rationale, and supported conclusions.
<u>TRACER Risk Assessment Report Case Study</u>	Risk scenarios, likelihood and impact reasoning, and treatment priorities.
<u>TRACER POA&M and Remediation Tracker</u>	Accountable remediation, milestone tracking, documentation gaps, and closure criteria.
<u>Cyber Control Readiness Internal Audit Case Study</u>	Evidence sufficiency, finding development, management response, and decision support.
<u>Luna Risk Introduction</u>	Accessible risk identification and security learning through concise visual narratives.

How this matrix should be read

The portfolio supplies direct evidence of applied Technology Risk and GRC work. Earlier operations leadership supplies the discipline behind the work: ownership, documentation, escalation, coordination, and follow-through. Together, they show how I approach risk work and how I contribute within a team or client environment.
